
Project Group:

Tim Hoyt
Dennis Herris
Glenn Gutierrez
Pat Moriarty

Vulcan

Final Project

OVERVIEW

Our goal is to create a web application that will allow small businesses (initially targeting restaurants) to connect with industry specific service providers. Customers (restaurants) will sign up and be able to view service providers information, experience/projects, and ratings. Service providers will be able to sign up and see job postings based on customer needs.

Importance

As a group we found that we had friends and family in the restaurant business that constantly have a hard time finding professional and reliable contractors that can do very specific work. For example, it is easy to find refrigeration repair but it is not easy to find someone that focuses on commercial refrigeration. The list goes on from table/booth repair, outdoor patio heater repair, hood/exhaust cleaning, etc. This app will provide a database of these types of service providers to restaurants and eventually all small businesses that need specific people to do specific work.

Roles

- Dennis will be working on the Google business api or other search options
- Pat will be working on login with Google Authentication
- Glenn will be working on deploying to AWS
- Tim will build out a react framework and begin seeding a database using MySQL so we have something to work with.
- We will all be working on finding assets and styling as we go.
